How Equinox runs

Each step reads only what earlier steps saved. The feed never calls a venue and never writes.

watch repeats steps 1 to 5 on its own: prices every 2 minutes, discovery every 30 minutes.

Command line

Output format for approval. Bracketed values are placeholders. Reasons use fixed sentence templates and are written to the log exactly as shown.

Run once

Refused with a reason while watch is running

```
$ equinox fetch
kalshi       saved [COUNT] cards, [COUNT] prices      skipped [COUNT]
             skipped: multivariate combo market      x [COUNT]
polymarket   saved [COUNT] cards, [COUNT] prices      skipped [COUNT]
             skipped: deadline does not parse        x [COUNT]
cycle [N] completed [TIME UTC]
```

```
$ equinox match
cards per subject   fed_funds_upper_bound   kalshi [COUNT]   polymarket [COUNT]

kalshi [ID]   polymarket [ID]   same       All payoff fields are equal.
kalshi [ID]   polymarket [ID]   opposite   The cutoffs are exact complements: gt 3.5 and lte 3.5.
kalshi [ID]   polymarket [ID]   not_same   The deadline differs: [TIME UTC] on kalshi, [TIME UTC] on polymarket.

compared [COUNT]   same [COUNT]   opposite [COUNT]   not_same [COUNT]
```

```
$ equinox route --side yes --as-of [TIME UTC]
kalshi [ID]   polymarket [ID]   same       buy_on_polymarket
    Polymarket yes costs [PRICE] and Kalshi yes costs [PRICE]. Fees were applied on both venues.
kalshi [ID]   polymarket [ID]   same       no_route
    The Polymarket yes price is stale: saved [TIME UTC], more than 10 minutes before as_of.
